

# Any DMS → Epic Gallery

FastLane

## Choosing a vendor to extract and transform your legacy data for Gallery?

Here's how our FastLane program for Gallery-bound data stacks up against the competition:

|                                                  | FastLane                                                                                                                                              | Other Programs                                                                                                                                    |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Extracts and converts from any legacy DMS</b> | <b>Yes.</b> Can extract and convert from any legacy DMS environment, including OnBase, ChartMaxx, OpenText, M-Files, Box.                             | <b>Limited.</b> Programs are often built around a single legacy DMS platform.                                                                     |
| <b>Hosted or on-prem</b>                         | <b>Both.</b> Hosted or on-prem with no data transfer appliance required.                                                                              | <b>Limited.</b> On-prem only, or limited and indirect ability to work with hosted environments.                                                   |
| <b>Third party involvement</b>                   | <b>No.</b> Proprietary methodology uses no third party tools, meaning no additional BAA obligations and PHI never leaves your environment.            | <b>Yes.</b> Utilizes third party tools, adding vendors, contracts, and more BAA obligations that come with added security review.                 |
| <b>Domestic extraction and conversion team</b>   | <b>Yes.</b> US-based team performs every step, so data and process stay accountable under US law.                                                     | <b>No.</b> Some offshore resources used, extending the chain of custody for your data.                                                            |
| <b>Legacy DMS expertise</b>                      | <b>High.</b> Veteran DMS and Epic professionals aren't learning on the job.                                                                           | <b>Low.</b> Teams have limited legacy platform experience and many are cutting their teeth on early projects.                                     |
| <b>Speed</b>                                     | <b>Fast.</b> In-house legal time turns contracts around quickly, then we offer kickoff within two weeks of signing. Extraction runs around-the-clock. | <b>Slower.</b> Back-and-forth contract process delays time-to-start. With less experience, delays, bottlenecks, and complications stall progress. |
